

TACOMA DOME

TACOMA, WASHINGTON

PROJECT SUMMARY

The City of Tacoma needed to replace the roof at the Tacoma Dome, the world's largest wooden domed arena, without interrupting a busy schedule of events, and without diminishing the unique aesthetic appeal of the structure.

SOLUTION

We designed and administered a reroof of the dome structure utilizing a thermoplastic roof assembly installed over the existing, sprayed-in-place polyurethane roof system. The membrane roof assembly precisely matched the five-color diamond pattern painted on the original roof, and the project was completed 'on budget', with only 1% of estimated cost in change orders.
